question
result (declared models and readouts)
evidence
not established
What kind of term is the constant slot?
One positive budget price under the hypotheses of §4.1; a common linear term only shifts it while the budget binds (§4)
theorem + Lean
What fixes its value?
Convergence readouts leave the background undetermined; with a global ledger it becomes a gauge modulus (§6)
theorem + Lean
Which values allow records?
≥ 10 of 12 seeds keep records iff $-1/8000 < \lambda \leq \lambda_+$, $3 < \lambda_+ < 3.4$; the coincidence ratio is not pinned (§5)
theorem + Lean
Is our epoch typical?
Depends on the declared prior: no tested prior meets the criterion; smoothness near zero is not enough (§7)
computation, counterexample
What do the data say?
Constant-compatible rewrite; regular density through the crossing; SN–BAO subset dependence flagged (§8)
pre-registered audit
identifying the price with physical Λ
a value of Λ
a physical prior over λ
ghost absence or stability of a fluid
a causal closure mechanism in data
