a
unequal allocations, one price
per-patch budgets:
same allocation,
unequal prices
one global price p
marginal utility $u_i(x)$
allocation x
b
common offset bx_i
global budget
no budget (control)
allocation shift $\max_i|\Delta x_i|$
allocation unchanged to 5.7×10^{-14};
price shifts by b (to 3.3×10^{-14})
$b=-0.2$
$b=+0.2$
c
price versus budget
optimality-condition price $p(B)$
$-\mathrm{d}V^*/\mathrm{d}B$ (finite diff.)
slack:
price $=0$
price p
global budget B
